Tacfast 'acts as a floor leveller'

A MECHANICAL fix system that sits above the subfloor, **TACFAST** is said by the manufacturer to be a cost-friendly way of fitting floors.

Featuring an interlocking disc and plate system that sits above the subfloor, and a hook and loop fastening system that attaches the floorcovering, TacFast acts as a leveller and can often eliminate the need for subfloor preparation.

The polypropylene Locplate plates work as a water barrier to prevent moisture migrating through the subfloor and affecting the

floorcovering. Any moisture will condense between the concrete surface of the subfloor and the Locplate layer.

Suitable for wood and laminate planks, carpet tiles, ceramics, natural stone and LVT, the TacFast system can be used for projects that require multi-floor installation. Flooring can be easily removed or replaced.
