Get a life

Lifecycle costs are the biggest bugbear of any flooring installation project. There are an seemingly unlimited amount of associated costs with floor fitting, but the revolutionary and fast-working TacFast mechanical fix system can help to eliminate these, leading to more cost-effective installations - great for budget-conscious and time-sensitive projects.

As Jonathan Stone, CCO, TacFast Systems International, explains, "The anticipated costs associated with a flooring installation project can seem endless. Factors such as subfloor preparation, materials, labour, and even future replacement costs all contribute to the overall budget and can increase project costs massively. But with TacFast, many of these issues are removed, allowing contractors, specifiers and end-users to save money without compromising on quality."

A simple, speedy and cost-friendly way of fitting floors, TacFast consists of a unique LocPlate interlocking disc and plate system that sits above the subfloor and a hook and loop fastening system that rapidly attaches the floorcovering. TacFast often eradicates the need for expensive and extensive subfloor preparation, acting as a leveller and a DPM in one. In fact, the polypropylene LocPlate plates work as a water barrier to prevent any moisture migrating through the subfloor, avoiding any future expensive maintenance costs potentially caused by damp.

The TacFast system does not require the use of adhesives with lengthy-drying times or unpleasant fumes, so it is instantly ready to go once the LocPlate surface is fitted.
