Succeeding with sub-floors

Fitters and contractors can avoid the time-consuming and expensive problems posed by poor-quality subfloors with the revolutionary TacFast mechanical fix system that provides a quick and cost-effective solution for fitting floors.

"Floor preparation issues often crop up, especially if the subfloor is in poor condition, and the associated costs with restoring it to a workable level can often spiral out of control, especially for budget-conscious projects, explains Jonathan Stone, CCO, TacFast Systems International. "And of course subfloor preparation can be an extremely lengthy process too, wasting time that could be spent better elsewhere. But TacFast eradicates the need for extensive preparation, saving both time and money without compromising on crucial quality."

Indeed, the TacFast system, which consists of a unique LocPlate interlocking disc and plate structure that is placed above the subfloor, and a hook and loop fastener that rapidly attaches the floorcovering, acts as a DPM and leveller. Acting as a water barrier to prevent moisture migration, the LocPlate layer can easily go over any cracks or gap and expansion joints to allow fitters to complete floor installations quickly and accurately, and with no possibility of damp later on. Requiring no adhesives, TacFast eradicates any lengthy drying times or unpleasant fumes, and critically it works with almost all types of floorcoverings, including wood and laminate planks, carpet tiles, ceramics, natural stone and LVT.

"The TacFast system really is a one-stop solution when it comes to fitting floors," continues Jonathan Stone. "Delivering real savings in terms of both time and cost, TacFast is quickly becoming the go-to installation method for a whole variety of flooring types. It's incredibly easy to use and promises fast, high-quality results."
